

Mobile Augmented Reality Using FOSS

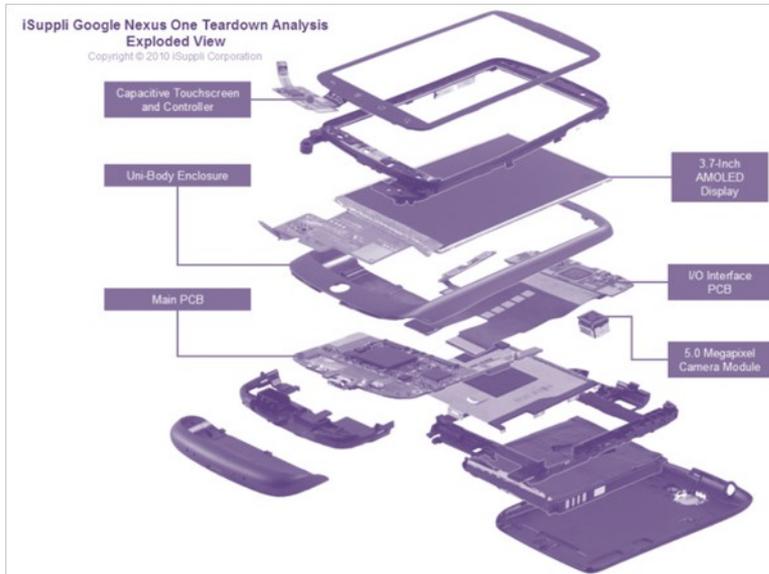

Open source AR in the wild

- Stats
 - Google Code: 104
 - SourceForge: 37
 - GitHub: ~75
- Mostly sketches, ARToolkit projects, libs and utilities
- Not seeing many full clients

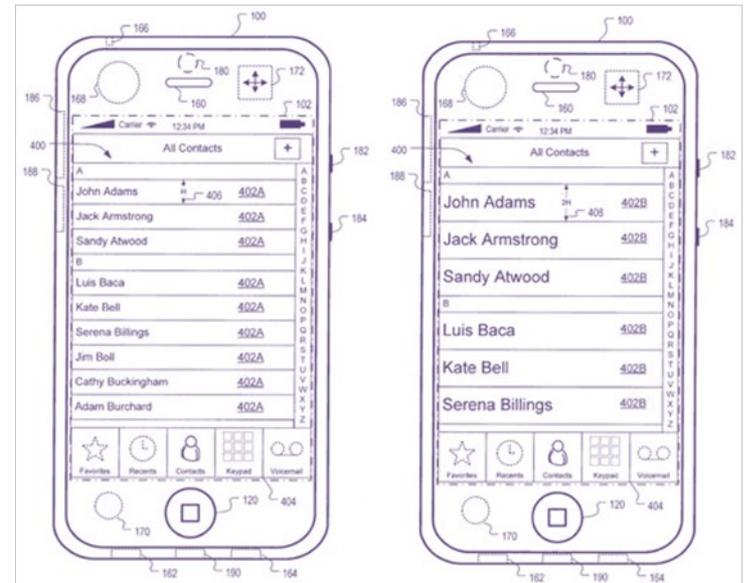

Mobile Augmented Reality (MAR) Platforms

Android

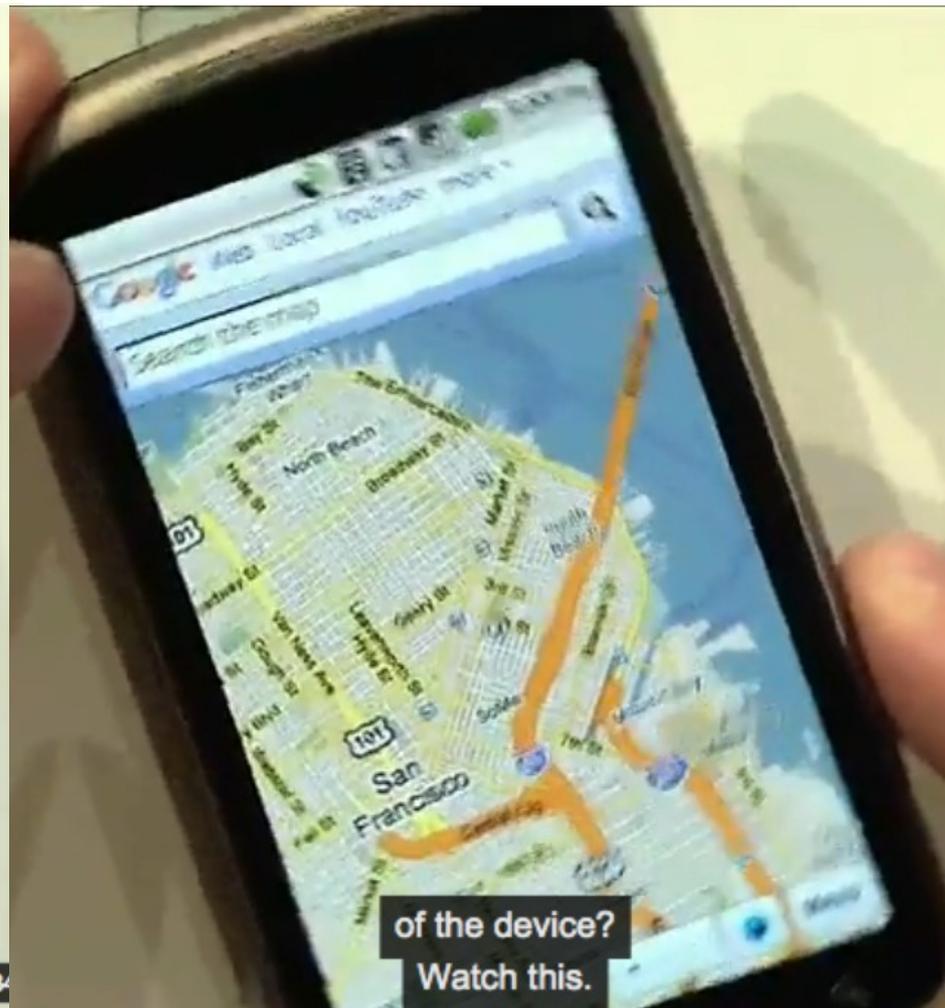

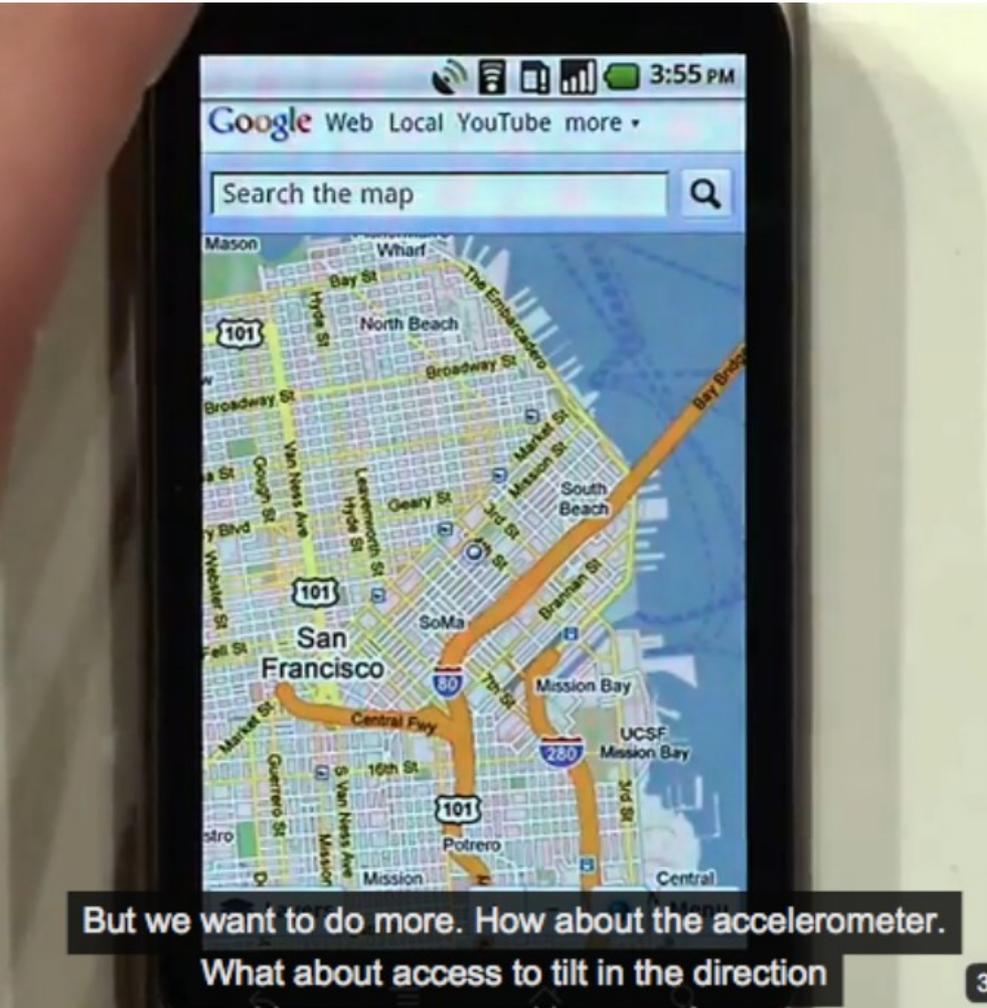

iOS

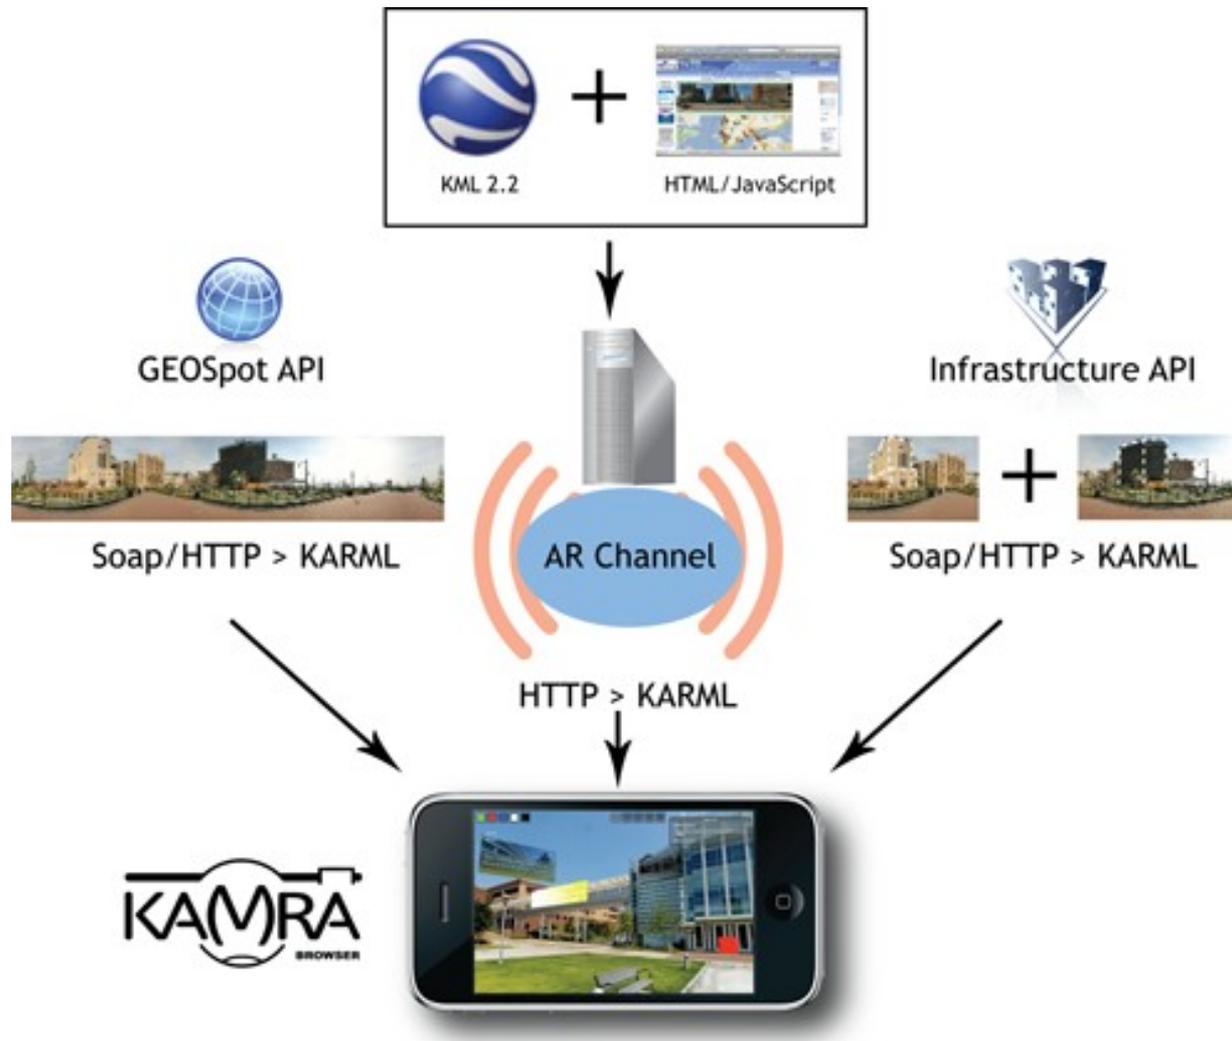

Current MAR Native Applications

MAR Web Applications

Kamra

MAR Web Applications

Barriers to open source

- Walled gardens/silos of AR data
- Fragmentation
 - Android
 - 1.5, 1.6, 2.0, 2.1,2.2
 - apps vary across carriers
 - Apple
 - iPhone, iPod Touch, iPad
 - iPad video out, determined by application

Client choices

- Evaluated available clients
 - Proprietary: Wikitude, Layar and Junaio
 - Open Source: gamaray and Mixare
- Commonalities
 - XML/JSON formats
 - Points of Interest
- Mixare – Android/java, most mature/active OS MAR project

Choices of Geo Data Servers

- Driven by client requirements
 - Required formats mostly XML or JSON based
 - Only point format supported, think POI (Points of Interest)
- Chose GeoServer
 - Java
 - Familiarity
 - Work for OpenGeo

Geoserver

- Create data output used by Mixare

```
{ "status": "OK", "num_results": 1,
  "results": [
    { "id": "2827",
      "lat": "46.43893",
      "lng": "11.21706",
      "elevation": "1737",
      "title": "Penegal",
      "distance": "9.756",
      "has_detail_page": "1",
      "webpage": "http%3A%2F%2Fwww.opengeo.org%2Fpic
        %2Fpicture.png"
    }
  ]
}
```

Geoserver

- Almost trivial with Geoserver-archetype-wfsoutputformat
 - Most of data contained in feature
 - Elevation from Geonames service
 - Added distance using a filter to modify response
 - JSON and GeoTools libs available and handy

Mixare

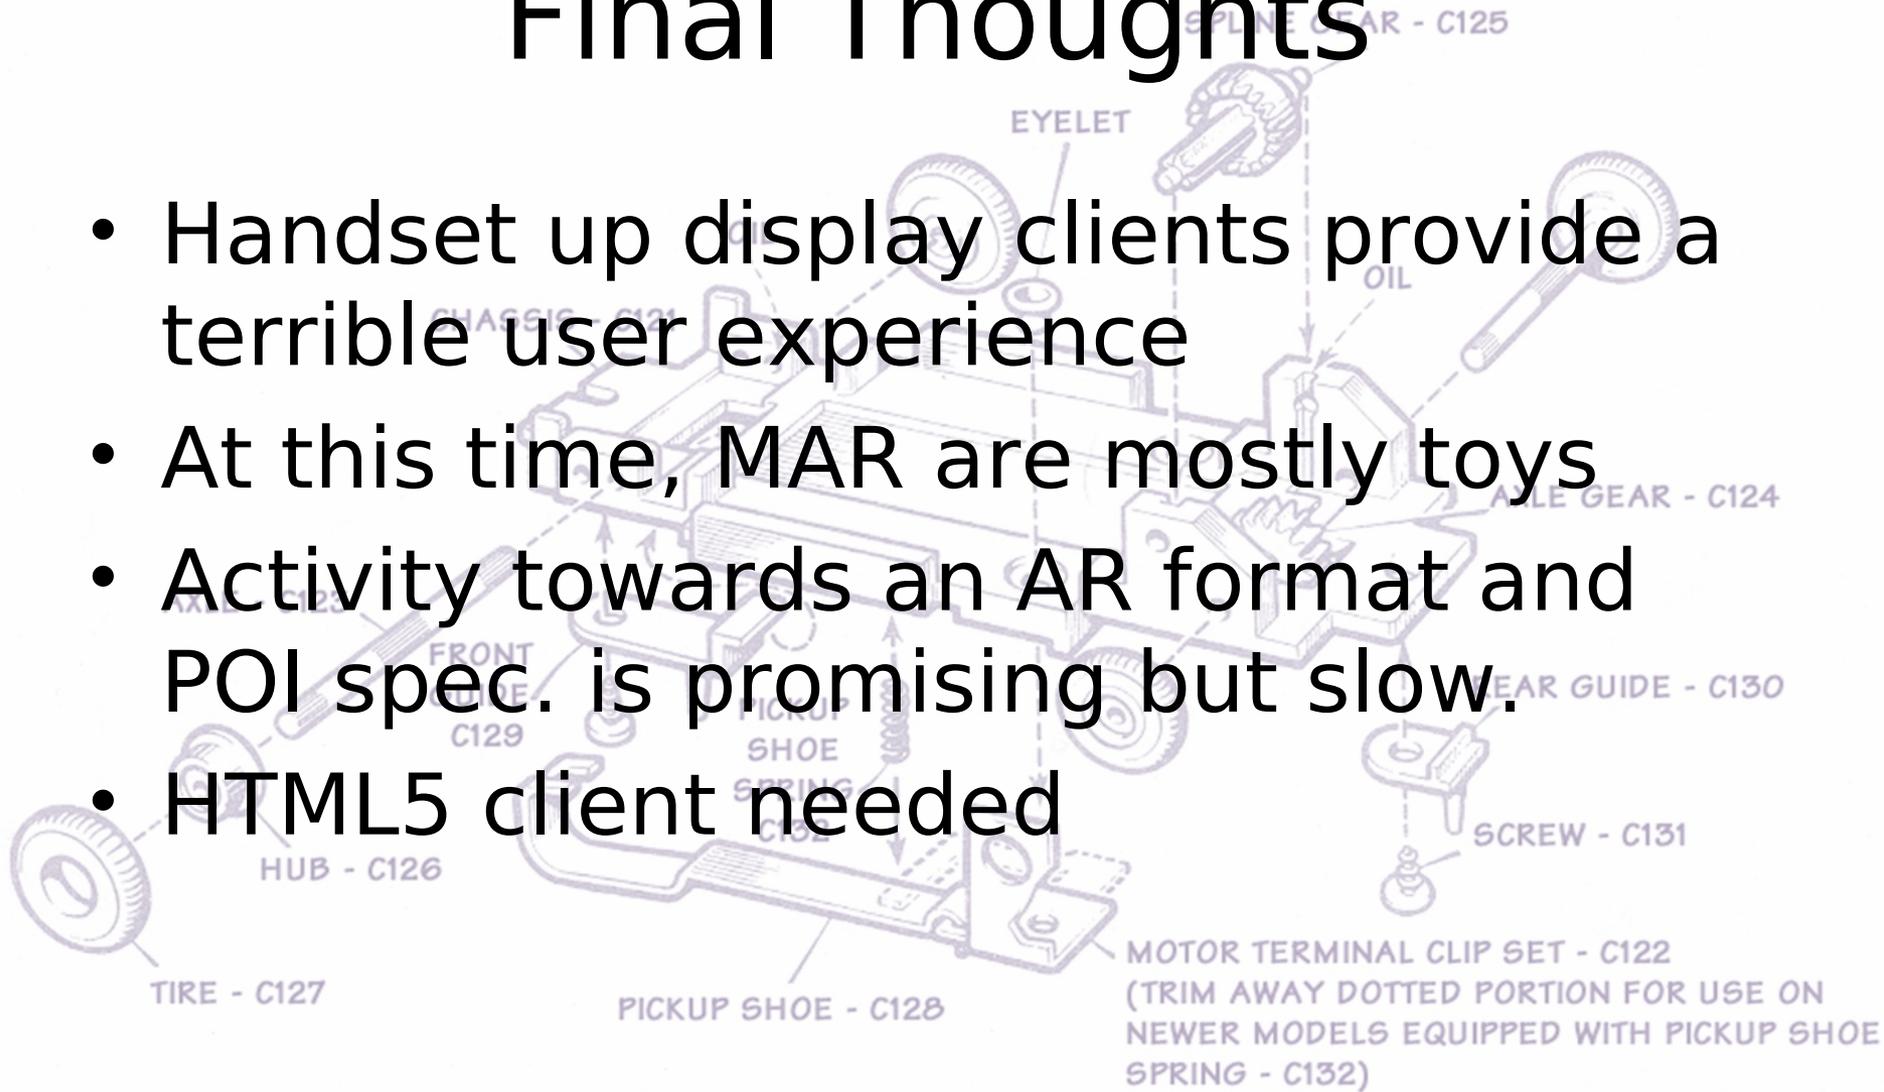

- Compilation
 - Failed on Android 1.6 (HTC Dream)
 - Worked on Android 2.1 (Droid, HTC EVO 4G)
 - Unstable on Android 2.2 - Cyanogen Mod 6.0 (HTC Dream)
- Works for the most part but user experience is not as rich as commercial clients.

Things I would do differently

- Correctly add vendor option, fix filter hack
- Create a WPS process to generate content
 - More flexible
 - Included in GeoServer 2.1 (just released)
- Stretch goal: add markerless tracking to Mixare using Kooaba or other image service

Final Thoughts

- Handset up display clients provide a terrible user experience
- At this time, MAR are mostly toys
- Activity towards an AR format and POI spec. is promising but slow.
- HTML5 client needed
