

This is where your title goes

Mr. Article Writer

November 26, 2010

Abstract

Insert a one or two paragraph abstract of your article here:

This template is designed as an overview of the OSGeo Journal production system. When you follow the methods laid out in this document, it will be very easy for editors to prepare your article in a timely manner.

A second paragraph can go in your abstract but don't make it more than that please.

Also note that short paragraphs with first lines indented looks awfully bad here. If you know the paragraphs will be maintained in the final version, you can "unindent" a paragraph like we did with this one, by using the `noindent` command at the beginning of the paragraph.

Now the main text of the document goes in here, between the end of the abstract and the final end for the document.

At this place please use sections to segment your writing. When sections are defined they create a nice header, they automatically get added to a table of contents for easy bookmarking and they help define the proper hierarchy for the overall document structure.

Let's create a new section below. Be sure to use Title Case.

1 This Is A New Section Heading

In this section you have your basic text, until you need a new section.

2 Onward To Our Next Section

Sections are hierarchical in nature and within each section you can have `subsection` commands as well:

2.1 First example

Subsections within a section will be at the same level as each other. If you want another level deeper you can go with `subsubsection` - yes, you read that correctly.

2.1.1 Getting Deeper

But then at the next `section` the hierarchy begins again.

3 Formatting

Nearing the end now... a few comments about formatting. For bold or emphasis use **the `textbf` command**. For a monospaced, verbatim sort of styling use **the `texttt` command**. We don't use a lot more than that!

For quotes you can use the left quote (usually below the tilde on US keyboards anyway) for the left single quote ‘ and the apostrophe for the right single quote’. For double quotes just repeat the symbol twice.

For more details on quotes and other basic formatting see: <http://en.wikibooks.org/wiki/LaTeX/Formatting> - this is also your example of how to code a URL.

4 Footnotes

In the Journal we make liberal use of footnotes, especially since we use a two column layout and there often isn't enough space in a column for a URL or long descriptive line. So wherever the text can be moved to a footnote, please consider it, especially if it improves the flow and readability of your article. For footnotes use the `footnote` command followed by the details to show in the footnote, for example in this footnote that refers to a URL.¹

5 Bibliography

6 Figures

Figure 1: The image caption goes here

Now in your text you can refer back to this figure by using a mention of Figure ?? here - which auto inserts your figure #. It won't show up until you build your document twice.

Note that the underscore is special character and as such requires a forward slash before it to allow it to build right in main text like `_this`. Same with `#` and `$` and more.

¹Our website has a long URL: <http://www.osgeo.org/ojs>
