

geomajas

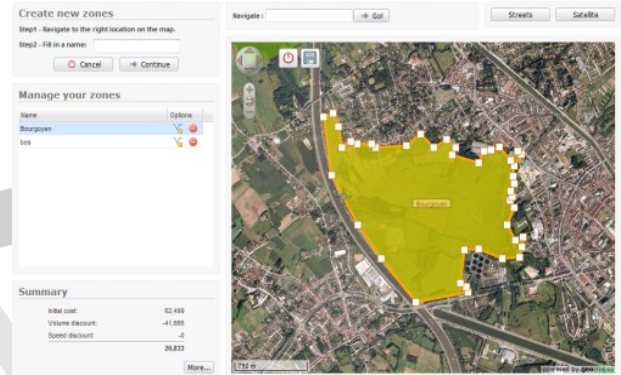

Geomajas is the extensible open source web mapping framework, enabling integrated GIS solutions for businesses and government.

It has sophisticated capabilities for displaying and managing geospatial information. Its **modular design** makes it easily extensible, while a **client-server architecture** guarantees endless scalability.

The focus of Geomajas is to provide a platform for server-side integration of geospatial data, allowing multiple users to control and manage the data from within their own browsers.

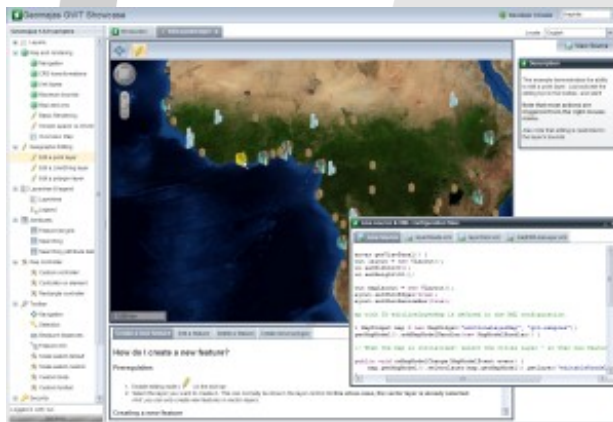

This means that you apply your security and business logic on the server before anything gets sent to the client, resulting in robust applications and a **real thin client**.

In essence, Geomajas provides a set of powerful building blocks, from which the most complex GIS applications can easily be built.

Core Features

- Integrated client-server architecture
- Geometry and attribute editing
- Custom attribute definitions
- Advanced querying capabilities (CQL)
- Out-of-the-box security
- Printing functionality
- Extensible plug-in mechanism
- Multiple front-end technologies
- Cross browser support, without the need for browser plug-ins
- Support for industry standard data formats and spatial databases
